INDEX

Ackermann's formula, 360
Algorithm(s) for
  controllability, 174
  constrained Sylvester equation, 497
  distance to uncontrollability, 186, 189
  distance to continuous-time unstable system, 225–6
  distance to discrete-time unstable system, 229–30
  eigenvalue assignment, 411–12, 417–18, 423–4, 425–8, 430–2, 437–8, 447–8
  eigenvalue computations, 84–6
  eigenvector computations, 90
  frequency response matrix, 144
  generalized eigenvalues, 99
  generalized eigenvectors, 99
  Hankel-norm approximation, 626–7
  H_2-norm, 212
  H_∞ norm, 376, 379
  integral involving matrix exponential, 137
  inertia and stability, 219
  internal balancing, 604, 607
  Kalman filter, 501
  large-scale computations in control, 653, 654, 655, 656, 657, 658, 659, 660, 661
  linear algebraic systems, 48, 53–4
  linear least-squares solution, 65–6, 72–3
  LQG design, 507
  LQR design, 366
  Lyapunov equations, 265–9, 274
  matrix exponential, 132, 135
  model reduction, 614, 616–7
  observer design, 472–3, 476–7, 479–80
  realization, 317, 322
  Riccati equations, 542–3, 553, 556–7, 558–9, 560–1, 563, 566, 568, 572, 574–5, 577
  singular value decomposition, 91, 92
  stability radius, 390
  Sylvester equations, 270–1
  Sylvester-observer equation,488, 492, 497
  subspace identification, 327, 330, 333

Back substitution, 38
Backward error in
  numerical linear algebra, 39
  Schur and Hessenberg-Schur methods, 276–8
Backward stability, 39
  and accuracy, 42
Balancing, 87
  using controllability and observability Grammians, 603
Balancing a stick: example, 113
Bass-Gura formula, 360
Bauer-Fike theorem, 44
Bidiagonalization
  using Householder method, 91–2
Bilinear transformation, 643
Bisection method for
  distance to instability, 225–6
  distance to uncontrollability, 187
  H-infinity norm, 376
  stability radius, 390–1
Block Hessenberg form, 173
Block diagonal matrix, 26
Block matrix, 26
Bode diagram, 146

CARE, 365
Cancellation, 37
Cart with inverted pendulum: example, 113
CASE STUDY: Ammonia Reactor, 678
Cauchy-Schwartz inequality, 28
Characteristic polynomial, 20
Cholesky factorization, 51

Closed-loop
matrix, 345
system, 345
Companion form, 25
lower, 25
upper, 25
Conditioning and sensitivity of
eigenvalue assignment, 443
eigenvalue problem, 44
feedback problem, 439–43
linear system, 41
Lyapunov equation, 253–8
matrix exponential, 127
Riccati equations, 530–8
stable Lyapunov equation, 253–7
Sylvester equation, 249–2
Continuous-time
controllability, 160
detectability, 343, 353
distance to instability, 223
distance to uncontrollability, 183
Kalman filter, 499
LQG design, 505
LQR design, 363
model reduction, 614–23
stability, 203
stabilizability, 345
stabilization, 345
constrained Sylvester-observer equation, 496–7
Continuous-time Lyapunov equations
solution of, 262–9, 284–6
Continuous-time Riccati equations
solution of, 542, 556, 563, 568, 572
Continuous-time Sylvester equations
solution of, 269–71, 278–9
Continuous-time Sylvester-observer equations
solution of, 485–96
Controllability
criteria of, 160, 164–5
Grammian, 210
index using controller-Hessenberg form, 181
Popov-Belevich-Hautus test of, 163
test using controller-Hessenberg form, 173–6
test using controllability Grammian, 210
Controller-canonical form, 170
Controller-Hessenberg form, 174
Control Systems Professional-Advanced Numerical Methods, 670
Covariance matrix, 500
DARE, 519
Deadbeat control, 463
Damping ratio, 355
Deflating subspace
methods for CARE, 556
methods for DARE, 550
of a matrix pencil, 100
Defective matrix, 21
Detectability, 353–4
Diagonal matrix, 23
Discrete-time
balancing, 609
controllability, 164
detectability, 354
distance to instability, 228
distance to uncontrollability, 183–4
LQG design, 508
LQR design, 372
stability, 213
stabilizability, 347
Discrete-time Lyapunov equations
solution of, 274–6, 289–91
Discrete-time Riccati equations
solution of, 541, 545, 558, 565, 574, 577
Distance to
uncontrollability, 183–4
instability, 223
rank-deficient matrices, 70–1
unstable system, 223
Dynamical systems, 1
Efficiency of an algorithm, 38
Eigenvalues
QR iteration method for finding, 83–9
QZ iteration for generalized, 94–7
Eigenvectors
inverse iteration for, 90
Eigenvalue assignment
comparison of different methods for, 453–4
conditioning of, 439–45
existence and uniqueness theorem for, 358–60
explicit QR algorithms for, 416–19, 420, 423, 425–7
implicit QR algorithm for, 420
partial, 436–8
robust, 445–8
RQ algorithm for, 417–8
recursive algorithms for, 411–12, 423–4

Schur method for, 431–2
via controller-companion form, 407
Eigenstructure assignment, 361–3

Feedback
conditioning of, 439
explicit formula for, 414
stabilization using Lyapunov equations, 348–53
stabilization using Riccati equations, 364
Floating-point number, 34
Flop, 38
Frequency response matrix
Hessenberg algorithm for, 144
Misra-Patel method for, 145
Functional observer(estimator), 513, 515

Gain margins, 370
Gaussian elimination
for LU factorization, 45–9
Gaussian zero-mean, 500
Generalized eigenvalues, 94
Generalized eigenvectors, 94
Generalized eigenvector method for Riccati equations, 550
Generalized Schur decomposition, 94
Generalized Schur methods for Riccati equations, 550
Givens
matrix, 60
QR factorization, 62
Grammian
Balancing and, 603
Controllability, 210
H_2 norm using, 211
Observability, 210
Lyapunov equations and, 210
Growth factor in Gaussian elimination, 50

Hamiltonian matrix, 366
Hamiltonian Schur form, 546
Hankel matrix of Markov parameters, 310
system identification using, 316–24
Hankel norm approximation, 623
Hankel singular values, 377
H_2 norm
using Lyapunov equation, 211–12
H-infinity control
state feedback, 381–2
output feedback, 383–5
H-infinity norm, 373
bounds for, 377–8
bisection method for, 376
two-step method for, 378–9
Hessenberg matrix
LU factorization of, 52
reduction to, 81–2
Hessenberg-triangular form
reduction to, 95–7
QZ algorithm and, 99
Householder
matrix, 57
QR factorization, 58
reduction to Hessenberg form, 81, 82
bidiognalization, 91, 92

Identification
frequency domain, 332–4
subspace stochastic, 329–31
Ill-conditioned problem, 42
IEEE standard for
floating point arithmetic, 34
Implicit QR algorithm for
eigenvalue computation, 85–6
Implicit QR theorem, 82
Impulse response matrix, 123
Inertia computation, 219–20
Inertia theorems, 217–18
Integrals involving matrix exponentials, 137–9
Internal balancing, 602
Invariant subspace, 20
and real-Schur form, 88
methods for Riccati equations, 540–66
Inverse
of a matrix, 22
Inverse-free
generalized Schur methods for Riccati equations, 555–9
Inverse iteration, 90
Internal balancing of
minimal realization using SVD, 603
nonminimal realization using square-root algorithm, 606–7
Iterative refinement
for linear system solution, 56

Jordan canonical form, 25

Kalman decomposition, 168–9
Kalman filter, 499
  gain, 501
  guaranteed stability of, 502
  guaranteed robustness of, 502
Kronecker product, 31
Krylov subspace methods for
  Lyapunov equations, 653–4
  model reduction, 659–62
  partial eigenvalue assignment, 659
  Riccati equation, 658–9
  Sylvester equations, 654–6
  Sylvester-observer equation, 657

Large-scale computations, see Krylov subspace methods
Least-squares solution
  minimum-norm, 73
  using normal equations, 65
  using QR factorization, 65–6
  using singular value decomposition(SVD), 72–3
List of
  algorithms, xxxiii–xxxv
  MATCONTROL functions, 674–7
LQG design
  separation property of, 506
LQR design
  guaranteed stability and robustness of, 368–72
LU factorization, 45
Luenberger
  canonical form, 171
  Observer, 471
Lyapunov equation
  analytical methods, 262–3
  Arnoldi methods for, 653–4
  Cholesky factor solutions of, 284–6, 289–91
  conditioning of, 253
  integral representation of solution of, 207
  Schur method for, 265–7, 274–5
  uniqueness of solution for, 248
Lyapunov stability theorem, 205

Machine epsilon,(precision), 36
MATCOM, 78, 103
MATCONTROL, 669
MATLAB
  Control system toolbox, 669
$MATRIX_X$, 671
Matrix exponential
  comparison of different methods for computing, 150
  computing integrals involving, 137–8
  conditioning of, 127
  eigenvalue-eigenvector method for, 129
  ordinary differential equation methods for, 134
  Pade' approximation method for, 131–3
  Schur method for, 135
  series method, 130
Matrix Sign-Function
  computation of, 560
  solving CARE using, 561–3
  solving DARE using, 565–6
Minimal realization
  SVD algorithm for, 317
  modified SVD algorithm for, 322
Model reduction
  balanced-truncation method for, 614
  comparison of different methods for, 635–6
  frequency weighted, 633
  H-infinity error bound for, 612
  Hankel-norm approximation for, 623–32
  Schur method for, 615–21
  singular perturbation approximation for, 644
  square-root method for, 621–2
Motion of a satellite: example, 116

Natural frequency, 355
Newton's method
  for CARE, 567
  for DARE, 574
  for distance to uncontrollability, 186
  with line search for CARE, 572
  with line search for DARE, 577
Nonderogatory matrix, 25
Norms 27, 28
  equivalence property of matrix, 29–30
  equivalence property of vector, 28
Normal equations
  for least-squares solution, 65
Nullspace, 21

Numerical rank, 72
Numerical stability, 39

Observability
  and observer-Hessenberg form, 183
  of continuous-time system, 165
  of discrete-time system, 167
Observability Grammian, 210
Observability test using block
    Hessenberg form, 183
Observer-canonical form,170
Observer design via
  eigenvalue assignment, 470 , 474–8
  Sylvester-observer equation, 472, 479–82
Observer theorem, 471
Optimal control of
  continuous-time systems, 364
  discrete-time systems, 372
Ordered real-Schur decomposition, 543
Orthogonal matrix, 23
Orthogonal projections, 22
  using QR decomposition, 63–4
  using SVD, 69
Orthogonal transformation: importance and
    significance, 79–80
Orthonormal bases, 20
  QR factorization and, 63–4
  SVD and, 69
Output feedback, 361
Overflow, 35

Padé approximation, 131
p-norm, 27
Partial eigenvalue assignment
  using Sylvester equation, 436–7
  using projection technique, 659
  using Schur method, 431–2
Permutation matrix, 24
Phase margins, 371
Pivoting in Gaussian elimination, 47–8
Poles, 141
Pole placement, see eigenvalue assignment
Positive definite matrix, 26

QR factorization
  complex, 60
  using Householder matrices, 58
  using Givens matrices, 62
  and Least-squares solution, 65–6
  and orthogonal projections, 63–4
  with column pivoting, 64
QR iteration, 84–6
QZ iteration, 94–9

Range of a matrix, 21
Rank, 21
Rank-deficient matrix, 21
Reachability, 164
Realization
  controllable, 309
  minimal, 310–11
  observable, 310
  SVD method for, 316–18
  modified SVD method for, 319–22
Real-Schur form, 83
Recursive algorithm for
  single-input eigenvalue assignment, 411
  multi-input eigenvalue assignment, 423
  Sylvester-observer equation, 486, 490
Reduced-order
  observer design via eigenvalue assignment,
    474–7
  observer design via Sylvester-observer
    equation, 479–80
Relative errors in matrix computations, 35
Riccati equations
  comparison of different methods for solving,
    581–2
  complex stability radius and, 386–8
  conditioning of, 530–9
  descriptor, 579–81
  eigenvector methods for, 540–1
  generalized eigenvector methods for, 550–1
  generalized Schur methods for, 552–5
  H-infinity Control and, 381–4
  inverse-free methods for, 555–9
  Kalman filter and, 499–504
  LQG design and, 505
  LQR design and, 363–7
  matrix sign-function methods for, 560–6
  Newton methods for, 566–77
  Schur methods for, 541–9
  stabilizing solution of, 366
RLC circuit: example, 109
Robust eigenvalue assignment, 445–50
Robust stability
  Lyapunov equation methods for, 230–1

Relative errors, 35
Rounding errors, 35

Scaling of Riccati equations, 544–5
Schur decomposition, ordered
  software for, 543
Schur method for
  eigenvalue assignment, 431
  Lyapunov equations, 265–9
  matrix exponential, 135
  model reduction, 616–17
  Riccati equations, 541–9
Separation of matrices, 249
Separation property of
  feedback design with observer, 483
  LQG design, 506
sep estimation, 261
Shifts in QR iteration, 86
Singular values, 67
  and rank of a matrix, 67
  computation of, 91
  and distance to instability, 225
  and distance to uncontrollability, 184
  least-squares solution using, 72–3
  insensitivity of, 68
Singular value plot, 146
SLICOT, 670
Software for control problems, 669–72
Software(selected) for
  controllability and Observability, 192–3
  distance to instability, 235
  distance to uncontrollability, 192
  eigenvalue assignment, 455–6
  feedback stabilization, 391–2
  LQG design, 509–10
  LQR design, 391
  Lyapunov equations, 293–5
  model reduction, 636–7
  Riccati equations, 583–4
  state estimation, 509–10
  Sylvester equations, 293–5
  system identification, 334–5
Spring-mass system: example, 111
Square-root method for
  internal balancing, 607
  model reduction, 621
Stability
  asymptotic, 203
  bounded-input bounded-output, 204
  bounded-input bounded-state, 204
  computation of, 218
  implicit matrix equation method for, 219–20
  Lyapunov, 205
  marginal, 203
  numerical, 39
Stabilizability of
  continuous-time system, 346
  discrete-time system, 347
Stabilization via
  Lyapunov equations, 348–52
  Riccati equations, 364
Stable eigenvalues, 203
Stable matrix, 203
Stability radius
  bisection method for, 390–1
  complex, 233, 386
  computation of, 390–1
  real, 233
Staircase algorithm, 174
State estimation via
  eigenvalue assignment, 470
  Sylvester-observer equation, 471
State-space representation of
  nonlinear systems, 112–13
  spring-mass system, 111–12
  systems modeled by partial differential
    equations, 118–19
State-space solutions of,
  continuous-time system, 122–3
  discrete-time system, 139–40
State-space model, 108–9
State-transition matrix, 122
Step response of a system, 124
Stochastic System
  state estimation of, 500
Structured stability radius, 232
Subspace system identification, 324–32
Sylvester equation
  characterization of nonsingularity of, 483–5
  conditioning of, 249–52
  Hessenberg method for, 278–80
  Hessenberg-Schur methods for, 269–71
  uniqueness of solution of, 247
Sylvester-observer equation
  constrained, 496
  recursive block triangular algorithm for,
    490–4
  recursive methods for, 486–90
Sylvester law of inertia, 216–17

Symplectic matrix, 529
System identification
  in frequency domain, 332–4
  in time domain, 324–2
System responses, 123–4

Time response, 123–4
Transfer functions, 141, 142
Triangular matrix, 23

Uncontrollable
  modes, 164
Uncontrollability
  distance to, 183
Underflow, 35
Unit step response, 124
Unreduced
  Hessenberg matrix, 24

vec operation, 31

White-noise, 211
Wilkinson matrix, 45
